

PATENT PENDING

This simple conversion product creates an electronic access control credential from your standard mechanical key and locks your business into more profits.

SmartKey™ Conversion Shells

SmartKey™ Conversion Shells contain an embedded pre-encoded prox coil. When fitted over the head of one of the below noted mechanical keys, the key is turned into a dual technology access credential. The key works as a normal mechanical key but can now be presented to any 125 kHz HID compatible proximity reader and is read just like a proximity access card. With SmartKey™, there is no need to carry a key and an access card! Wiegand 26 bit formats are supported.

SmartKey™ Conversion Shells are currently available for Best, Schlage C/Primus/Abloy Protec, Schlage Everest and Jet Big/Neuter Bow. Support for the Jet Big Bow allows any keyway available with that key design to be used with SmartKey™.

Conversion Shells are designed with a unique offset which allows the embedded transponder to be located well away from the key. This, plus the use of specially wound coils allow the key to be read up to three inches from the reader, even through a user's fingers!

Conversion Shells come pre-encoded and labeled for use with 125 kHz HID compatible proximity readers such as CanProx One readers from Cansec Systems.
